1 Introduction **1**

2 Functional Requirements **1**

2.1 Features 2

1 Introduction

The SafeCatChat application is intended to be a safe, secure, sovereign data platform for medical professionals to communicate with their patients. It is built with strict guidelines that can ensure the confidentiality, integrity, and availability of patient data.

In this work package we will focus on creating the Medical Professional Patient Communication View. This view will provide a general overview of patient communication and statuses with detailed information accessed by selecting or clicking on icons, links, etc.

2 Functional Requirements

The first set of functional requirements is illustrated in Figure 1. This wireframe was developed to provide a quick overview of a Medical Professional's Patients. This view is the crucial entrypoint that all medical professionals will first see when they enter the application, and will use the most to manage their patient's health.[1]

This wireframe matches the following set of user stories:

> As a Medical Professional I want to see at a glance my active patients for the day So that I know how many patients I will see

[1] This is an educated guess and assumption at this time. However, through the use of the Evidential platform plugin, we will test this hypothesis the ensure it is accurate and correct.
